

Two versions of Tubes. One live picture of the slate.

For Martin Waterman and the team at Motion Media Group. Tubes is production software with management overviews on top, for one or more underlying production companies: the companies run their productions in **Tubes Production**, and MMG follows every production, every company and all companies together in **Tubes Portfolio**. Same live data, no manual consolidation in between. This onepager is the short version; the full proposal alongside it explains how each part works.

FOR MOTION MEDIA GROUP

MMG Tubes Portfolio

- One real-time dashboard over every connected production
- Early warnings the day a forecast moves past budget
- Cashflow and margin forecast per company, by month, quarter and year
- AI analyses across the slate
- Drill-down: portfolio → company → production → invoice
- Read-only share links for investor reporting
- Optional standard templates, rolled out group-wide

Follow and steer, without running the productions.

FOR EVERY COMPANY OR FILM YOU FINANCE

Tubes Production

- One or more productions and series per workspace
- Create projects; build budgets or import Movie Magic directly
- Real-time cost control: budget → PO → invoice → forecast
- Invoice processing with automatic reading and approvals
- Xero or other accounting software, connected when wanted
- Day planning, call sheets and a crew app on the same data
- Local currency and language per company; fixed exchange rates per production

Run the production, head office sees the rollup.

Connected by a signup link. A production company onboards itself in 5–10 minutes and arrives pre-configured with MMG's standard setup. No implementation project.

START

Required investment

the slate is funded; every production gets its workspace

SET UP

Development & budget

build the budget in Tubes or import Movie Magic

CONTROL

Cost control & operational finance

POs, invoices, forecasts, accounting

RUN

Planning & call sheets

operations on the same data as the money

5–10 min

for a production company to onboard itself

On time

an overrun is visible before costs are processed and committed. Not at the next report, or months later

1 dashboard

over the whole slate, in real time

10 languages

the major Western languages, per company or per user · local currency, fixed FX rates per production

Financial benefits

- 1 Overruns surface at commitment time.** weeks before they reach a cost report, while rescoping a shoot day or renegotiating a vendor is still possible, instead of a write-off.
- 2 Group consolidation stops being manual.** The portfolio view is built from the teams' own live data, finance hours go back to finance, and re-keying errors go away.
- 3 Cashflow planned on numbers, not estimates.** Forecasts per production company by month, quarter and year show when capital goes out and comes back, the timing a capital-recycling model runs on, with margin forecast alongside.
- 4 Investor reporting from live numbers.** Read-only links replace assembled quarterly spreadsheets, faster reporting cycles, and a transparency story that sells.
- 5 No switching cost.** Movie Magic budgets import directly; teams change nothing on day one and adopt more when it pays.
- 6 No implementation cost.** Self-onboarding via a signup link in 5–10 minutes, no consultants, no IT project, built to start fast.
- 7 One system instead of five.** Budgeting, cost control, invoices, planning, call sheets and crew communication on one data set, fewer tools to license, sync and reconcile across jurisdictions.

Numbers that matter

A sample of the graphs and reports Tubes can show you; the product holds many more views, per production and across the slate.

Cash position and funding tranches

One feature film: investment received in parts, spend drawing it down. Illustrative

■ Cash position ■ Tranche received ● Next tranche flagged

The team has received part of the investment; Tubes projects the position forward from committed spend and flags when the next tranche is needed, well before it is. The same view rolls up per company and for the slate.

Variance per production

Forecast (EFC) vs budget across the slate of media productions. Illustrative

■ Under budget

All four productions on or under budget. The moment a forecast crosses its budget, the production is flagged, long before a cost report would show it. In the product this is live, per production and rolled up per company.

In short

- ✓ **Two versions:** MMG follows in Tubes Portfolio; companies run in Tubes Production.
- ✓ **Every production connected:** budget → PO → invoice → forecast, live.
- ✓ **Early warnings and AI analysis** at group level, drill-down to the invoice.
- ✓ **Cashflow and margin forecast** per company, month, quarter, year.
- ✓ **Movie Magic imports directly**, adoption is gradual, no forced migration.
- ✓ **Self-onboarding via your signup link**, 5–10 minutes, standard setup and optional templates applied.
- ✓ **International by default:** each company in its local currency, with fixed exchange rates per production; the 10 major Western languages, per company or user.
- ✓ **Price per minute and per episode**, unit costs comparable across productions.
- ✓ **Investor-ready:** read-only share links on live numbers.
- ✓ **Support included:** help at signup, training when needed, hands-on help to get companies going.
- ✓ **Proposal:** a pilot with one of the productions you finance.
